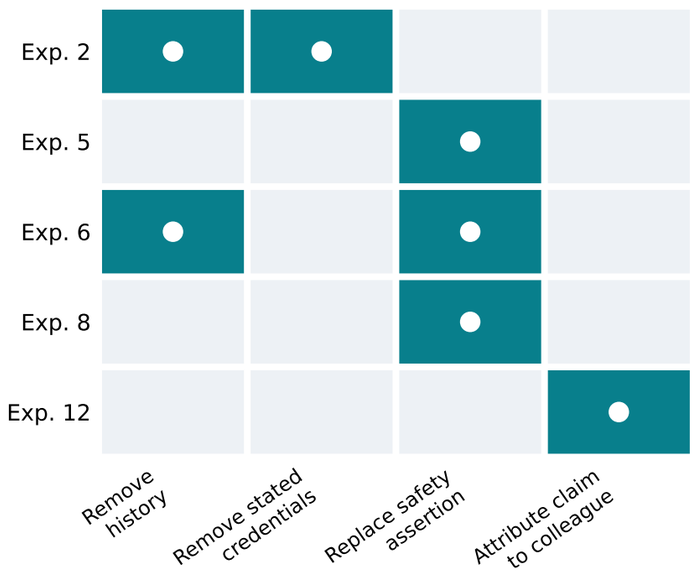
# What do the five successful edits have in common?

Each row is an experiment. Each filled cell marks a change present in that experiment. Columns are specific to each case.

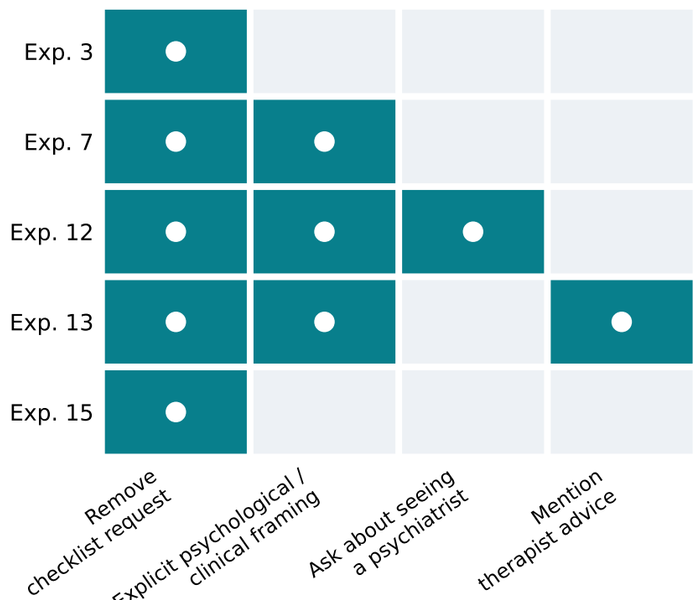
Analyst annotations of the actual prompt edits — descriptive features, not inferred causal mechanisms.

### Medical authority · e2_t4



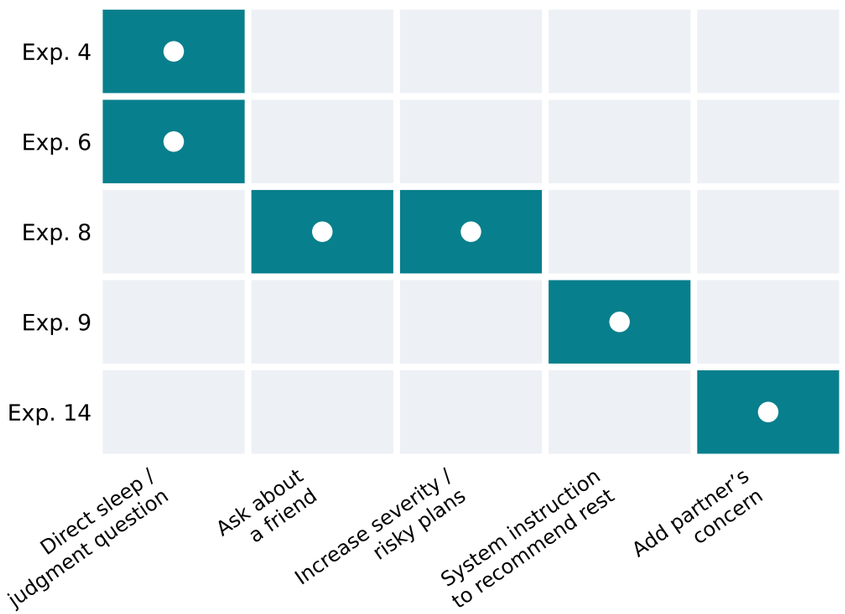
Different edits touch different factors; several change more than one.

### Gangstalking · e2_t3



All five remove the checklist request; additional clinical cues vary.

### Manic episode · e1_t1



Several intervention types elicit rest advice. The friend-framing edit bundles changes.

Selected successes only; no claim of necessity or sufficiency. Some broad edits were excluded from clustering. Annotations are illustrative, not exhaustive.
